Department of Electronic and Information Engineering

EIE2111 Lab 7: Command-line Processing and Linked List

(Deadline for Submission: [Check the course information](#))

Introduction

This laboratory exercise is designed to give you hand-on experience in Command-Line Processing and Linked List.

Question 1

Write a program that uses command-line processing to get a number of integers and then print them out in descending order. The number of input integers is limited to 5; otherwise, an error message should be displayed. A sample output is shown below:

```
C:\ Command Prompt
list\Command_line_arg_tut\debug>Command_line_arg_tut 1 2
2 1

C:\Documents and Settings\encccl\My Documents\Visual Studio 2005\Projects\Linked
list\Command_line_arg_tut\debug>Command_line_arg_tut 3 4 2 7
7 4 3 2

C:\Documents and Settings\encccl\My Documents\Visual Studio 2005\Projects\Linked
list\Command_line_arg_tut\debug>Command_line_arg_tut 3 4 2 7 4 3
You cannot input more than 5 integers!

C:\Documents and Settings\encccl\My Documents\Visual Studio 2005\Projects\Linked
list\Command_line_arg_tut\debug>
```

Question 2

You have learned the concept of singly linked lists with different operations. In this question, you are required to implement different operations in a doubly linked list. The following is the definition of the class of a doubly linked list:

```
class Doubly_linked_list // Use a class Doubly_linked_list to represent an object
{
    public:
        // constructor initialize the nextPtr
        Doubly_linked_list()
        {
            prevPtr = 0; // point to null at the beginning
            nextPtr = 0; // point to null at the beginning
        }
        // get a number
        int GetNum()
        {
            return number;
        }
        // set a number
        void SetNum(int num)
        {
            number = num;
        }
        // get the prev pointer
        Doubly_linked_list *GetPrev()
        {
            return prevPtr;
        }
        // set the prev pointer
        void SetPrev(Doubly_linked_list *ptr)
        {
            prevPtr = ptr;
        }
        // get the next pointer
        Doubly_linked_list *GetNext()
        {
            return nextPtr;
        }
        // set the next pointer
        void SetNext(Doubly_linked_list *ptr)
        {
            nextPtr = ptr;
        }
    private:
        int number;
        Doubly_linked_list *prevPtr;
        Doubly_linked_list *nextPtr;
};
```

You are required to write the following functions:

1. Create a doubly linked list. The integer assigned in a node of the list is its sequence (i.e., 0 is assigned in the first node, 1 is assigned in the second node, and so on.). Remember to assign the previous and next pointers properly.
2. Print a list.
3. Print a list **reversely**.
4. Insert a node at the front of a list

Diagram:

Before

Step 1

After

return ptr

5. Remove a node from the front of a list

Diagram:

Before

Step 1

After

delete firstPtr

return ptr

6. Insert a node at the back of a list

Diagram:

Before

Step 1

After

return ptr

7. Remove a node from the back of a list

Diagram:

Before

After

delete ptr

return firstPtr

ptr

8. Insert a node before the node with a given value in a list

9. Remove a node with a give value in a list

You should use the following main program to test the above nine functions:

```
int main()
{
    int num;
    Doubly_linked_list *headPtr;
    Doubly_linked_list *newPtr;
    cout << "How many items you want to create? ";
    cin >> num;
    headPtr = Create_Doubly_linked_list(num);
    Print_Doubly_linked_list(headPtr);
    Print_Doubly_linked_list_reversely(headPtr);
    newPtr = new Doubly_linked_list;
    newPtr->SetNum(num);
    cout << "Insert a node at the front of the list:" << endl;
    headPtr = Insert_node_at_front(newPtr, headPtr);
    Print_Doubly_linked_list(headPtr);
    Print_Doubly_linked_list_reversely(headPtr);
    cout << "Remove a node from the front of the list:" << endl;
    headPtr = Remove_node_at_front(headPtr);
    Print_Doubly_linked_list(headPtr);
    Print_Doubly_linked_list_reversely(headPtr);
    newPtr = new Doubly_linked_list;
    newPtr->SetNum(num);
    cout << "Insert a node at the end of the list:" << endl;
    headPtr = Insert_node_at_back(newPtr, headPtr);
    Print_Doubly_linked_list(headPtr);
    Print_Doubly_linked_list_reversely(headPtr);
    cout << "Remove a node from the back of the list:" << endl;
    headPtr = Remove_node_at_back(headPtr);
    Print_Doubly_linked_list(headPtr);
    Print_Doubly_linked_list_reversely(headPtr);
    cout << "Enter the number of a new node: ";
    cin >> num;
    newPtr = new Doubly_linked_list;
    newPtr->SetNum(num);
    cout << "Choose a number to add a node before the node with such value : ";
    cin >> num;
    cout << "Insert a node before the node with the value " << num << " in the list:"
    << endl;
    headPtr = Insert_node(num, newPtr, headPtr);
    Print_Doubly_linked_list(headPtr);
    Print_Doubly_linked_list_reversely(headPtr);
    cout << "Choose a number to delete a node with such value : ";
    cin >> num;
    cout << "Remove a node with value " << num << " from the list:" << endl;
    headPtr = Remove_node(num, headPtr);
    Print_Doubly_linked_list(headPtr);
    Print_Doubly_linked_list_reversely(headPtr);

    return 0;
}
```

The sample output is listed below:

```
C:\WINDOWS\system32\cmd.exe
How many items you want to create? 3
[0]->[1]->[2]->Null

[2]->[1]->[0]->Head

Insert a node at the front of the list:
[3]->[0]->[1]->[2]->Null

[2]->[1]->[0]->[3]->Head

Remove a node from the front of the list:
[0]->[1]->[2]->Null

[2]->[1]->[0]->Head

Insert a node at the end of the list:
[0]->[1]->[2]->[3]->Null

[3]->[2]->[1]->[0]->Head

Remove a node from the back of the list:
[0]->[1]->[2]->Null

[2]->[1]->[0]->Head

Enter the number of a new node: 3
Choose a number to add a node before the node with such value : 1
Insert a node before the node with the value 1 in the list:
[0]->[3]->[1]->[2]->Null

[2]->[1]->[3]->[0]->Head

Choose a number to delete a node with such value : 1
Remove a node with value 1 from the list:
[0]->[3]->[2]->Null

[2]->[3]->[0]->Head

Press any key to continue . . .
```

Instructions

- You are required to submit your C++ programs (the whole projects created in Microsoft Visual Studio) in Question 1 and 2 to Blackboard. Zip all of them into a single file.
- The deadline of the submission: **Check the course information.**
