

The Hong Kong Polytechnic University

Department of Electronic and Information Engineering

EIE2111 Lab 8: File Processing

(Deadline for Submission: Check the course information)

Question

You are the owner of a hardware store and need to keep an inventory that can tell you what different tools you have, how many of each you have on hand and the cost of each one.

- (a) Write a program that initializes the sequential file `hardware.txt`, lets you input the data concerning each tool, enables you to list all your tools, lets you delete a record for a tool that you no longer have and lets you update *any* information in the file. The tool identification number should be the record number. Use the following information to start your file:

Record #	Tool name	Quantity	Cost
3	Electric sander	7	57.98
17	Hammer	76	11.99
24	Jig saw	21	11.00
39	Lawn mower	3	79.50
56	Power saw	18	99.99
68	Screwdriver	106	6.99
77	Sledge hammer	11	21.50
83	Wrench	34	7.50

- (b) Repeat (a) but this time you use the random access file `hardware.dat`. You should create a class for the above records and create an object for each record. When you create the random access file, you need to create 100 empty records.

Instructions

- You are required to submit your C++ programs (the whole projects created in Microsoft Visual Studio) to Blackboard. Zip all of them into a single file.
- The deadline of the submission: Check the course information.
